dwg files with dynamically-placed geometry can be created using the newest BIM technologies. In the past, we used this type of workflow when creating.dwg files: - .dwg with drawing - .dwg with symbol library - .dwg with vector and rendering In this example, we use a combination of .dwg with symbol library and .dwg with dynamically-placed geometry. Let's take a look at the procedure: .dwg with drawing Open the drawing file by the following procedure: ```{r, eval=FALSE} data("mymap") ``` Open the drawing file in a designer readr("rwd_nim11_01.dwg", TRUE) Save the drawing by the following procedure: draw.save(file = "rwd_nim11_01.dwg", overwrite = FALSE) After that, we have .dwg file with drawing. Now, we can draw geometry as a symbol. draw.symbol("SymbolName", label = "Maintainer", data = "Maintainer") This procedure creates the geometry from the symbol. draw.symbol("SymbolName", label = "Admin", data = "Admin") For more information about the .dwg files with dynamically-placed geometry, please refer to [Adaptive Building Elements: A Workshop Design Science Methodology](draw.symbol("SymbolName", label = "Builder", data = "Builder") `` 82157476af
